

Human Anatomy and Body Systems

Levels of Organization

Remember, the human body is organized in several levels, from the simplest to the most complex. . .

Cells – the basic unit of life

Tissues – clusters of cells performing a similar function

Organs – made of tissues that perform one specific function

Organ Systems – groups of organs that perform a specific purpose in the human body

***The purpose of the 11 organ systems is for the human body to maintain **homeostasis**.

The 11 Human Body Systems

The 11 human body systems are as follows:

- nervous system
- respiratory system
- excretory system
- muscular system
- endocrine system
- immune system
- integumentary system
- digestive system
- skeletal system
- circulatory system
- reproductive system

The Digestive System

Purpose: to convert food particles into simpler micromolecules that can be absorbed into the bloodstream and used by the body

Major Organs and their Functions:

Mouth – to chew and grind up food

-- saliva also begins the chemical breakdown

Esophagus – pipe connecting mouth to stomach

Stomach – secretes an extraordinarily strong acid (pH = 2) that leads to breakdown of food

-- once the food is broken down in the stomach and mixed with digestive juices, it is called **chyme**

Pancreas – produces the hormone **insulin** that regulates blood sugar levels

-- also help neutralize stomach acid

Liver – produces bile, which breaks down fats in foods

Gallbladder – pouch-like organ that stores **bile** for future use

Small Intestine – after digestion is complete, the chyme enters the small intestine where it is absorbed into the bloodstream

-- the chyme is propelled along by folded surfaces called **villi**, on the intestine

Large Intestine – removes water from the chyme and gets the waste ready for excretion

The Digestive System

The Excretory System

Purpose: to rid the body of wastes, including excess water and salts

Major Organs and Their Functions

Kidneys – the main organs of the excretory system

-- waste-laden blood enters the kidney and the kidney **filters** out urea, excess water and other waste products, which eventually travel out of the kidney as urine

-- eventually they travel through the **ureter** to the urinary **bladder**

Rectum – solid (food) waste travels out of the body through the rectum

Skin – sweat glands remove excess water and salts from the body

Lungs – expel the waste gas carbon dioxide

The Excretory System

Figure 19.1 <http://pinkmonkey.com/studyguides/subjects/biology-edited/chap19/b1919201.asp>

The Respiratory System

Purpose: to provide the body with a fresh supply of oxygen for cellular respiration and remove the waste product carbon dioxide

Major Organs and Their Functions

Nose – internal entry and exit point for air

Pharynx – serves as a passage way for both air and food at the back of the throat

Larynx – your “voicebox”, as air passes over your vocal chords, you speak

Trachea – the “windpipe”, or what connects your pharynx to your lungs

-- a piece of skin, called the **epiglottis**, covers the trachea when you swallow, preventing food from entering

Bronchi – the two large passageways that lead from the trachea to your lungs (one for each lung)

- the bronchi are further subdivided into bronchioles

- eventually, the further subdivisions lead to tiny air sacs called **alveoli**

 - alveoli are in clusters, like grapes

 - capillaries surrounding each alveolus is where the exchange of gases with the blood occurs

The **diaphragm** is the muscle that causes you to breath

- hiccups are involuntary contractions of the diaphragm

Image of the Respiratory System

The Circulatory System

Purpose: to deliver oxygenated blood to the various cells and organ systems in your body so they can undergo cellular respiration

Major Organs and Their Functions

Heart – the major muscle of the circulatory system

- pumps blood through its four chambers (two ventricles and two atria)

- pumps deoxygenated blood into the lungs, where it gets oxygenated, returned to the heart, and then pumped out through the aorta to the rest of the body

- valve regulate the flow of blood between the chambers

Arteries – carry blood away from the heart and to the major organs of the body

Veins – carry blood back to the heart away from the major organs of the body

Capillaries – small blood vessels where gas exchange occurs

Blood – the cells that flow through the circulatory system

-- red blood cells contain hemoglobin, an iron-rich protein that carries oxygen

-- white blood cells function in the immune system

-- platelets help in blood clotting

Spleen – helps to filter out toxins in the blood

Image of the Circulatory System

The Nervous System

Purpose: to coordinate the body's response to changes in its internal and external environment

Major Organs and Their Functions

Brain – control center of the body, where all processes are relayed through

-- consists of cerebrum (controls thought and senses) and cerebellum (controls motor functions)

Spinal Cord – sends instructions from the brain to the rest of the body and vice versa

-- any organism with a major nerve cord is classified as a **chordate**

Nerves – conduct impulses to muscle cells throughout the body

The Endocrine System

Purpose: to control growth, development, metabolism and reproduction through the production and secretion of hormones

Major Organs

- hypothalamus
- pituitary gland
- thyroid
- parathyroid
- adrenal glands
- pancreas
- testes
- ovaries

The Skeletal System

Purpose: to provide structure and support to the human body

Bones are where new blood cells are generated (in the marrow), and require the mineral **calcium** for strength

Major Bones of the Human Body

- femur (thigh bone)
- radius and ulna (lower arm)
- sternum (breastbone)
- fibula and tibia (calf)
- scapula (shoulder)
- coccyx (tail bone)
- humerus (upper arm)
- cranium (skull)
- clavicle (shoulder blade)
- vertebrae (back)
- pelvic bone
- phalanges (fingers/toes)

The Muscular System

Purpose: works with the skeletal and nervous system to produce movement, also helps to circulate blood through the human body, muscle cells are fibrous. muscle contractions can be voluntary or involuntary.

Major Muscles in the Human Body

-- biceps

-- triceps

-- deltoids

-- glutes

-- hamstrings

Muscle Diagram

The Immune System

Purpose: to remove infectious diseases and other pathogens from the human body

Major Organs and Their Functions

Skin – also called the integumentary system, the skin is the body's first line of defense

White Blood Cells – recognize disease agents (antigens) and create antibodies to tag and remove these antigens

-- phagocytes are the white blood cell type that actually eats and destroys these antigens

Lymph Nodes – help restore fluid lost by the blood and return it to the circulatory system

Figure 2
How the Human Immune System Reacts to Viral Invasions

Figure 2

The Integumentary System

Purpose: is to act as a barrier to protect the body from the outside world. It also functions to retain body fluids, protect against disease, eliminate waste products, and regulate body temperature. **Major Organs and Their Functions.**

Skin Layers

The Reproductive System

Purpose: is a system of sex organs within an organism which work together for the purpose of sexual reproduction

Male Major Organs

Penis – The primary male reproductive sex organ used for insemination

Testicles- the male gonad used to produce sperm and to produce androgens, primarily testosterone.

Epididymis- is a tube that stores sperm and connects a testicle to a vas deferens in the male reproductive system

Prostate gland- stores and secretes the white alkaline portion of semen

Seminal vesicle- They secrete fluid that partly composes the semen.

Vas Deferens- transport sperm from the epididymis to the ejaculatory ducts in anticipation of ejaculation.

Urethra- is a tube that connects the urinary bladder to the urinary meatus for the removal of fluids from the body

The Reproductive System

Female Major Organs

Ovary –ovum-producing reproductive organ in female reproductive system.

Endometrium-inner epithelial layer, along with its mucous membrane, of the mammalian uterus.

Cervix- is the lower part of the uterus in the human female reproductive system

Vagina- muscular and tubular part of the female genital tract, which in humans extends from the vulva to the cervix

Uterus- or womb is a major female hormone-responsive reproductive sex organ, location where the fetus develops.

Fallopian tube- are two very fine tubes lined with ciliated epithelia, leading from the ovaries of female mammals into the uterus, where fertilization takes place.

Warm-UP

1. **Get out activity worksheet from reproduction unit**
2. **Circulate the classroom discussing with other students possible answers for the questions you still had.**
3. **When you have answered your questions find your seat.**

Does anyone have any questions that are still unanswered?
